

# CUSTOMER SYNC

Application

#### **ABSTRACT**

This Customer Management System performs CRUD operations using JSP/Servlet for the backend and MySQL for the database.

# Customer Management System Documentation Contents

#### 1. Introduction

 Description: This project is a CRUD (Create, Read, Update, Delete) application for managing customer data. The system utilizes a MySQL database, with the backend developed using JSP/Servlet and the frontend built with HTML, CSS. The application includes secure JWT-based authentication and integrates with a remote API for synchronizing customer data.

#### 2. Technologies Used

Database: MySQL:

An overview of the MySQL database used to store customer data, including the schema design and key tables.

Backend: JSP/Servlet:

Describes the backend technologies used, focusing on the choice between JSP/Servlet. This section covers the rationale for the chosen technology and its role in the application.

Frontend: HTML, CSS:

A brief introduction to the frontend stack, explaining the use of HTML for structure, CSS for styling.

Authentication: JWT (JSON Web Tokens):

An explanation of JWT authentication, its importance in securing the application, and how it is implemented.

#### 3. Data-Base Development

Create the Users Table: Ensure your users table in MySQL has columns for an auto-incremented ID, login ID, and password. You can also add additional fields as needed.

```
sql
CREATE TABLE users (

id INT PRIMARY KEY AUTO_INCREMENT,
login_id VARCHAR(255) NOT NULL UNIQUE,
password VARCHAR(255) NOT NULL
);
```

#### **Create the CustomerDetails Table:**

here is the SQL command to create the customerdetails table with the specified columns:

```
CREATE TABLE customerdetails (

id INT AUTO_INCREMENT PRIMARY KEY,
firstname VARCHAR(255) NOT NULL,
lastname VARCHAR(255) NOT NULL,
street VARCHAR(255),
address VARCHAR(255),
city VARCHAR(255),
state VARCHAR(255),
email VARCHAR(255),
unid VARCHAR(20),
uuid VARCHAR(250)
);
```

#### 4. Backend Development

Setting Up the Backend Environment:
 Instructions for setting up the backend development environment, including tools, dependencies, and configuration settings.

Follow some steps:

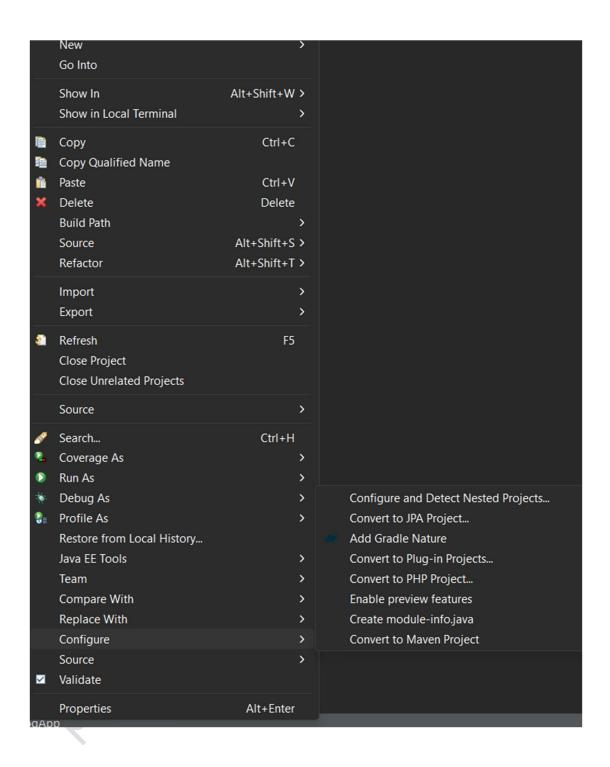

### Creating java project

#### **Follow some steps:**

Create Java Dynamic Web Project

Click on project

It shows

Click on configure and convert to maven project

#### In pom.xml it shows and add dependencies

#### Add Dependencies

#### For Json

#### For httpclient

```
<dependency>
     <groupId>org.apache.httpcomponents</groupId>
     <artifactId>httpclient</artifactId>
          <version>4.5.13</version>
          </dependency>
```

#### For Jaxb-api

#### For JWT

At final your code looks like

```
<packaging>war</packaging>
  <build>
    <plugins>
      <plugin>
        <artifactId>maven-compiler-
plugin</artifactId>
        <version>3.8.1
       <configuration>
          <release>17</release>
        </configuration>
      </plugin>
      <plugin>
        <artifactId>maven-war-
plugin</artifactId>
      </plugin>
  </build>
  <dependencies>
   <dependency>
       <groupId>io.jsonwebtoken</groupId>
       <artifactId>jjwt</artifactId>
       <version>0.9.1
   </dependency>
   <dependency>
          <groupId>mysql</groupId>
          <artifactId>mysql-connector-
iava</artifactId>
```

```
<version>8.0.30
  </dependency >
  <dependency>
      <groupId>javax.xml.bind
      <artifactId>jaxb-api</artifactId>
      <version>2.3.1
  </dependency>
  <dependency>
<groupId>org.apache.httpcomponents/group
<artifactId>httpclient</artifactId>
      <version>4.5.13
  </dependency>
  <dependency>
      <groupId>org.json</groupId>
      <artifactId>json</artifactId>
      <version>20231013
  </dependency>
```

</project>

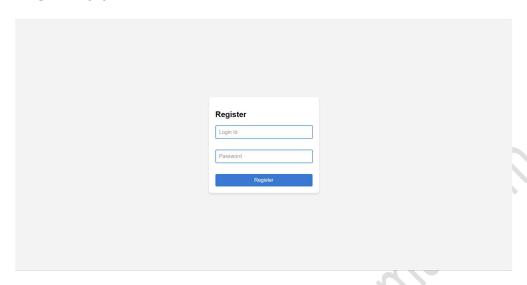

Index.jsp

# **Customer Sync**

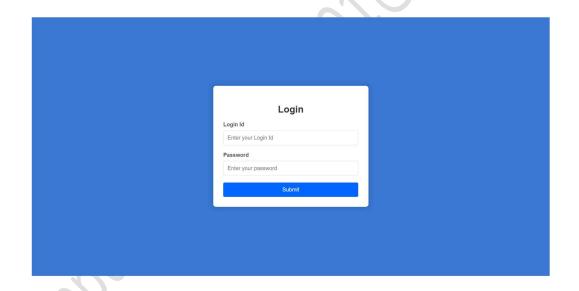

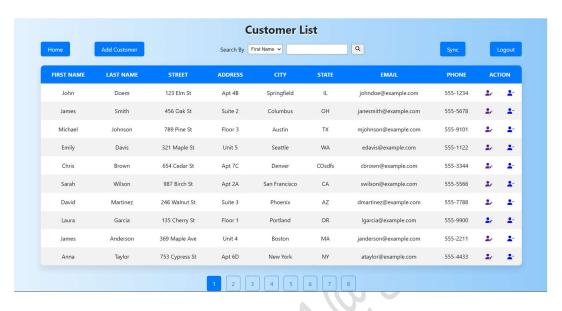

## Register.jsp

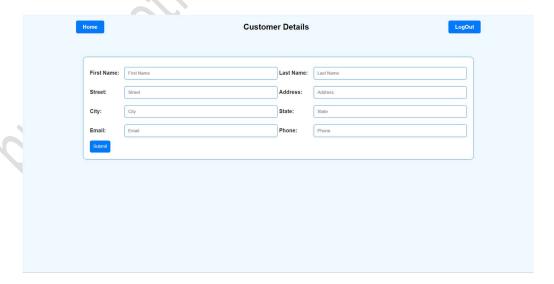

## Login.jsp

#### customerlist.jsp

- API Specifications
  - Create Customer: Detailed specifications for the API that handles creating new customer records.

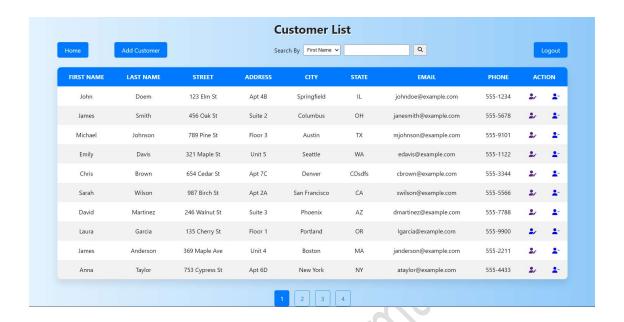

Update Customer

- Get Customer List (with Pagination, Sorting, and Searching)
- o Get Customer by ID
- o Delete Customer
- JWT Authentication Implementation

#### 4. Data Synchronization Feature

- Integration with Remote API
- Sync Button Implementation
- Data Update Logic
